Education

Vellore Institute of Technology

May 2026

Bachelor of Technology, Computer Science; GPA: 8.88

Vellore, Tamil Nadu

Coursework: Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Database Management Systems, Computer Networks

Problem Solving: 250+ DSA problems solved on LeetCode (C++)

Technical Skills

Languages: C++ (STL), JavaScript, TypeScript, Python, SQL

Backend: Node.js, Express.js, FastAPI, Distributed Systems, Microservices, REST APIs, Event-Driven Architecture, MongoDB Atlas, Redis, RabbitMQ, Socket.IO, JWT, Jest

Frontend: React.js, Zustand, Tailwind CSS, HTML5, CSS3

AI Engineering: RAG Pipelines, Vector Embeddings, Pinecone, Gemini API

Cloud & Infrastructure: Linux, Docker, Docker Compose, Nginx, AWS EC2, Git, CI/CD (GitHub Actions)

Experience

Influcon Digital

May 2025 – July 2025

Frontend Developer Intern

Remote / Kolkata

- Translated Figma mockups into an 8-section company website using React and Tailwind CSS, building a custom sticky-stacking scroll section with an embedded video header using React Hooks and Intersection Observer.
- Collaborated with the development team and product designer through iterative feedback cycles, researching and evaluating frontend libraries against project requirements and delivering regular progress updates.

TimeSlotter

May 2024 – July 2024

Full-stack Developer Intern

Remote / Vellore

- Built and Postman-tested RESTful APIs with Node.js and Express for user management, bookings, and JWT-based authentication, and refactored MongoDB schemas to improve data consistency.

Projects

DSA DUEL | *React, Node.js, Python, FastAPI, Socket.IO, Judge0, Pinecone, Gemini* | [Live](#) | [GitHub](#)

- Built a real-time competitive coding platform where two users solve LC75 problems under synchronized server-authoritative timers using Socket.IO; validated with load testing at 300 concurrent clients achieving 100% successful room joins.
- Architected a Python/FastAPI RAG microservice that stores 130+ vector embeddings in Pinecone and retrieves grounded context through similarity search to power an AI-driven post-match review assistant.
- Deployed independent Node.js and Python services on Render with MongoDB Atlas, developed via a feature-branch Git workflow with pull requests.

SOCIAL MEDIA BACKEND | *Node.js, Distributed Systems, Microservices, RabbitMQ, Redis* | [GitHub](#)

- Engineered a distributed event-driven backend comprising four independently deployable microservices (Identity, Post, Media, Search) behind a centralized API Gateway with JWT authentication.
- Orchestrated asynchronous service communication using RabbitMQ topic exchanges, where `post.deleted` events trigger media cleanup and search index updates across dependent services.
- Implemented Redis caching on paginated feed APIs and centralized rate limiting at the API Gateway to reduce redundant database reads under repeated requests.

STREAMHUB | *React.js, Node.js, Express.js, Socket.IO, FFmpeg, Docker, NGINX RTMP, AWS EC2* | [Live](#) | [GitHub](#)

- Developed a browser-based live streaming platform enabling authenticated users to broadcast webcam and microphone feeds.
- Engineered a real-time FFmpeg transcoding pipeline converting WebM streams into H.264/AAC for RTMP delivery to YouTube and a Dockerized NGINX RTMP server, with 9 automated Jest and Supertest tests.
- Deployed the platform on AWS EC2 using Docker Compose, Nginx, HTTPS (Let's Encrypt), and GitHub Actions CI/CD for automated testing and deployment.

Technical Writing

Medium | [JWTs Are Stateless Until They Aren't](#)

- Explains how refresh tokens and token revocation introduce server-side state into JWT-based authentication systems, along with practical design considerations.
